TR-380
G.fast Performance Test Plan

Issue: 2
Issue Date: June 2021
Notice

The Broadband Forum is a non-profit corporation organized to create guidelines for broadband network system development and deployment. This Technical Report has been approved by members of the Forum. This Technical Report is subject to change. This Technical Report is owned and copyrighted by the Broadband Forum, and all rights are reserved. Portions of this Technical Report may be owned and/or copyrighted by Broadband Forum members.

Intellectual Property

Recipients of this Technical Report are requested to submit, with their comments, notification of any relevant patent claims or other intellectual property rights of which they may be aware that might be infringed by any implementation of this Technical Report, or use of any software code normatively referenced in this Technical Report, and to provide supporting documentation.

Terms of Use

1. License
Broadband Forum hereby grants you the right, without charge, on a perpetual, non-exclusive and worldwide basis, to utilize the Technical Report for the purpose of developing, making, having made, using, marketing, importing, offering to sell or license, and selling or licensing, and to otherwise distribute, products complying with the Technical Report, in all cases subject to the conditions set forth in this notice and any relevant patent and other intellectual property rights of third parties (which may include members of Broadband Forum). This license grant does not include the right to sublicense, modify or create derivative works based upon the Technical Report except to the extent this Technical Report includes text implementable in computer code, in which case your right under this License to create and modify derivative works is limited to modifying and creating derivative works of such code. For the avoidance of doubt, except as qualified by the preceding sentence, products implementing this Technical Report are not deemed to be derivative works of the Technical Report.

2. NO WARRANTIES
THIS TECHNICAL REPORT IS BEING OFFERED WITHOUT ANY WARRANTY WHATSOEVER, AND IN PARTICULAR, ANY WARRANTY OF NONINFRINGEMENT AND ANY IMPLIED WARRANTIES ARE EXPRESSLY DISCLAIMED. ANY USE OF THIS TECHNICAL REPORT SHALL BE MADE ENTIRELY AT THE USER'S OR IMPLEMENTER'S OWN RISK, AND NEITHER THE BROADBAND FORUM, NOR ANY OF ITS MEMBERS OR SUBMITTERS, SHALL HAVE ANY LIABILITY WHATSOEVER TO ANY USER, IMPLEMENTER, OR THIRD PARTY FOR ANY DAMAGES OF ANY NATURE WHATSOEVER, DIRECTLY OR INDIRECTLY, ARISING FROM THE USE OF THIS TECHNICAL REPORT, INCLUDING BUT NOT LIMITED TO, ANY CONSEQUENTIAL, SPECIAL, PUNITIVE, INCIDENTAL, AND INDIRECT DAMAGES.

3. THIRD PARTY RIGHTS
Without limiting the generality of Section 2 above, BROADBAND FORUM ASSUMES NO RESPONSIBILITY TO COMPILE, CONFIRM, UPDATE OR MAKE PUBLIC ANY THIRD PARTY ASSERTIONS OF PATENT OR OTHER INTELLECTUAL PROPERTY RIGHTS THAT MIGHT NOW OR IN THE FUTURE BE INFRINGED BY AN IMPLEMENTATION OF THE TECHNICAL REPORT IN ITS CURRENT, OR IN ANY FUTURE FORM. IF ANY SUCH RIGHTS ARE DESCRIBED ON THE TECHNICAL REPORT, BROADBAND FORUM TAKES NO POSITION AS TO THE VALIDITY OR INVALIDITY OF SUCH ASSERTIONS, OR THAT ALL SUCH ASSERTIONS THAT HAVE OR MAY BE MADE ARE SO LISTED.

All copies of this Technical Report (or any portion hereof) must include the notices, legends, and other provisions set forth on this page.

Executive Summary

The goal of TR-380 is to provide a set of test cases to measure the performance between a DPU and one or more CPEs.

The test plan includes test setup information, equipment configuration requirements, test procedures, and pass/fail requirements for each test case.

Issue 2 of this Technical Report adds single-line coax throughput tests, updates to the physical layer test setup and noise accuracy verification procedures, and a correction to the attainable net data rate test.
1 Purpose and Scope

1.1 Purpose

TR-380 provides a set of performance test cases and related pass/fail requirements for G.fast implementations according to ITU-T Recommendations G.9700 [1] and G.9701 [2].

The performance tests defined in WT-380 complement the testing requirements defined within the Broadband Forum's Gfast certification program and its associated ATP-337[7] test plan.

The goal of TR-380 is to provide performance requirements between a DPU and one or more CPEs. The test cases are defined for a DPU and CPE combination.

Technical content in this test plan includes test setup information, equipment configuration requirements, test procedures, and pass/fail requirements for each test case.

1.2 Scope

This Technical Report is intended to provide a performance test plan for ITU-T Recommendation G.9700 “Fast access to subscriber terminals (G.fast) – Power spectral density specification”[1] and G.9701 “Fast access to subscriber terminals (G.fast) – Physical layer specification” [2].

G.fast provides significant flexibility in transceiver functionality through configuration and therefore it is not practical to include tests for all possible combinations. Since network architectures and deployment practices vary greatly amongst service providers, the network conditions (loop models, noise models, loop lengths, etc.) were selected to represent nominal conditions under which (interoperability) performance is tested. This test plan is focused on ensuring laboratory repeatability such that equipment from different vendors can be validated and compared.

Operator specific scenarios, including testing with loop types, lengths, or noise scenarios, that may be specific to a deployment, are outside the scope of this document. This Test Plan is applicable to CPE’s, single-port and multi-port DPUs. Test cases applicable only to multi-port DPUs are clearly identified as conditional test cases.

Performance testing in the presence of reverse power feeding is out of scope of this issue of TR-380.

1.3 Test plan passing criteria

The tests contained in this document are each marked with a test status, indicating: “mandatory,” “conditional mandatory,” or “optional.” These terms are defined in section 2.3.

For the purpose of determining a summary result, such as indicating a system “passes TR-380 testing,” the system SHALL pass all “mandatory” tests and all applicable “conditional mandatory” tests. “Optional” tests SHALL not impact the summary result.

A system is a combination of a DPU and one or more CPEs and is referred to as ‘System Under Test’ or ‘SUT’ in the remainder of the testplan.

Different sets of tests may apply depending on the media type supported (e.g., twisted pair, coax).

The testplan only defines the requirements for each individual test case. For some tests, parameters are recorded for reporting purposes only. These parameters might be useful for debugging purposes.
2 References and Terminology

2.1 Conventions

In this Technical Report, several words are used to signify the requirements of the specification. These words are always capitalized. More information can be found in RFC 2119 [3].

**SHALL**
This word, or the term “REQUIRED”, means that the definition is an absolute requirement of the specification.

**SHALL NOT**
This phrase means that the definition is an absolute prohibition of the specification.

**SHOULD**
This word, or the adjective “RECOMMENDED”, means that there may exist valid reasons in particular circumstances to ignore this item, but the full implications need to be understood and carefully weighed before choosing a different course.

**SHOULD NOT**
This phrase, or the phrase “NOT RECOMMENDED” means that there may exist valid reasons in particular circumstances when the particular behavior is acceptable or even useful, but the full implications should be understood and the case carefully weighed before implementing any behavior described with this label.

**MAY**
This word, or the adjective “OPTIONAL”, means that this item is one of an allowed set of alternatives. An implementation that does not include this option SHALL be prepared to inter-operate with another implementation that does include the option.

2.2 References

The following references are of relevance to this Technical Report. At the time of publication, the editions indicated were valid. All references are subject to revision; users of this Technical Report are therefore encouraged to investigate the possibility of applying the most recent edition of the references listed below.

A list of currently valid Broadband Forum Technical Reports is published at [www.broadband-forum.org](http://www.broadband-forum.org).

2.3 Definitions

The following terminology is used throughout this Technical Report.

- **Conditional mandatory** Tests marked as “conditional mandatory” also include a conditional statement, which if met, indicates the test SHALL be considered as “mandatory.” If the conditional statement is not met, the test SHALL be considered as “optional” or “not applicable.”

- **Mandatory** Tests marked as “mandatory” SHALL be performed when completing testing according to this test plan.

- **Optional** Tests marked as “optional” MAY be completed at the request of the tester or equipment manufacturer.

2.4 Abbreviations

This Technical Report uses the following abbreviations:

- AGN: Additive Gaussian Noise
- CPE: Customer Premises Equipment
- DPU: Distribution Point Unit
- DTU: Data Transfer Unit
- ETR: Expected Throughput
- FLR: Frame Loss Ratio
- FRA: Fast Rate Adaptation
- FTU: G.fast Transceiver Unit
- FTU-O: FTU at the Optical Network Unit (i.e., operator end of the loop)
- FTU-R: FTU at the Remote site (i.e., subscriber end of the loop)
- GDR: Gamma Data Rate
- G.fast: Fast access to subscriber terminals
- HON: Higher Order Node
- LAN: Local Area Network
- LOM: Loss of Margin
- LOR: Loss of RMC
- LOS: Loss of Signal
- MAC: Media Access Control
- MAE: Mean Absolute Error

3 Technical Report Impact

3.1 Energy Efficiency
TR-380 has no impact on energy efficiency.

3.2 Security
TR-380 has no impact on security.

3.3 Privacy
TR-380 has no impact on privacy.
4 Equipment Features

4.1 System Under Test information

Table 1 and Table 2 are intended to provide test engineers and readers of the test report with sufficient information about the SUT in order to assure repeatability of results and to allow for comparisons of reported test results. The information defined in the tables SHALL be provided to the test engineer prior to the start of the testing and SHALL be included as part of the test report. All fields SHALL be populated; if an item is not applicable to the DPU or CPE, the item MAY be marked as “Not Applicable.”

<table>

</tbody>
</table>
4.2 Management of the DPU and CPE

The DPU SHALL support a DPU Northbound management protocol that allows the ability to configure and retrieve the G.997.2 managed objects used in this test plan.

The CPE is managed through the DPU-MIB and the G.9701 initialization/eoc/RMC. No LAN-side management protocol is required for the execution of this test plan, except as required to configure the CPE to pass Ethernet traffic between the G.fast and LAN interface(s).
5 Test Environments

This section contains all the specifications and information required for building the basic testing environment (e.g., test configurations, test setup characteristics, configuration settings of the System Under Test, and setup of the simulated network environment) for the G.fast test cases defined in this test plan. Test case specific configuration settings are defined in their related section.

5.1 Test Configurations

5.1.1 Ethernet/IP Traffic Setup

The CPE and DPU SHALL support means to pass Ethernet/IP traffic through the G.fast link.

The DPU and CPE each SHOULD support the following requirements to enable these tests. Figure 1 shows the basic setup for passing Ethernet/IP traffic through the DPU and CPE device in a single line test.

The DPU SHOULD support:
1. Forwarding of Ethernet traffic between the G.fast interface(s) and the northbound Ethernet interface, based on MAC learning or VLAN markings.

The CPE SHOULD support at least one of the following configurations:
1. IPv4 Bridging between the WAN and LAN ports, as defined in TR-124 Issue 3, WAN.BRIDGE.1.
2. IPv4 Port Forwarding between the WAN and LAN ports, as defined in TR-124 Issue 3, LAN.PFWD.1.

The CPE SHALL be configured for forward IPv4 traffic for UDP Port 1024 between the WAN and LAN.

![Figure 1 – Test setup for Ethernet/IP traffic with single line test](image)

The test leads, shown in Figure 1, used to connect the Physical Layer Test Setup to the DPU and CPE(s) SHALL be of 1 meter ± 2.5 cm length and SHALL be of type CAT6 or better.

The Ethernet/IP Traffic Generator/Analyzer shown in Figure 1 is not able to distinguish whether Ethernet frames are dropped in the DPU, the CPE, the HON, or the Ethernet switch. Hence, when verifying that no Ethernet frames are dropped in the SUT, a background frame loss ratio (FLR) of 4e-7 is allowed as to not fail the SUT for frames dropped outside its control.

**Note:** An FLR of 4e-7 corresponds with about 10 dropped downstream frames and 3 dropped upstream frames when running Ethernet traffic at a 1 Gbit/s aggregate net data rate at the default 4:1 downstream:upstream split ratio for 5 minutes, with a frame size distribution as defined in section 5.1.2. This FLR of 4e-7 accommodates the cascading of up to 4 Ethernet interfaces (as shown in Figure 1),

June 2021 © The Broadband Forum. All rights reserved
each at an FLR of 1e-7. A minimum of 5 dropped frames is allowed for the test to be statistically relevant given the measurement time.

For the test setup for Ethernet/IP traffic with single line test shown in Figure 1,

1. The purpose of the Ethernet Switch is to allow a single port to be used on the Ethernet traffic generator/analyzer for the CPE side testing. If multiple ports are used on the Ethernet traffic generator/analyzer, this switch may be eliminated.

2. If used, the Ethernet switch SHALL support a backplane switching speed so as not to limit the performance of the G.fast system, i.e., greater than the summation over all lines of the upstream and downstream G.fast net data rates.

3. The Ethernet connection between the switch and Ethernet traffic generator/analyzer link speed SHALL be 10 Gigabit Ethernet or better.

Test traffic SHALL be defined as Ethernet frames containing the headers shown in Table 3.

### Table 3 – Ethernet/IP test frame definition

<table>
<thead>
<tr>
<th>Ethernet Frame Header</th>
<th>VLAN Tag</th>
<th>IPv4 Header</th>

<tr>
<td>MAC Destination/Source Addresses, etc.</td>
<td>Optional, downstream flow only</td>
<td>IP4 Source/Destination Addresses, etc.</td>
<td>UDP Port, etc.</td>
<td>Pseudo-random bit pattern</td>
</tr>
</tbody>
</table>

The information listed in Table 4 SHALL be used to construct the Ethernet/IP frames used for testing. Fields not defined SHALL be calculated according to the appropriate standard (e.g., RFC791 [4] on IPv4) or SHOULD use well known and/or industry-default values. Frames received by the CPE LAN interface, for transmission in the upstream direction, SHALL NOT include a VLAN tag. Frames transmitted in the downstream direction MAY include a VLAN tag, if required by the HON and/or DPU.

Payload

| Datagram Payload | PRBS | PRBS | Pseudo-random bit pattern filling remainder of frame bytes. |

Note 1: The destination MAC address might be dependent on the configuration of the CPE.

Note 2: For CPE devices supporting Bridge Mode, IP2 SHALL equal IP3.

5.1.2 Ethernet Traffic Frame Sizes

The following describes the Ethernet traffic and frames sizes which SHALL be used within each test case described in this document, unless specified otherwise within the specific test case (e.g., where a single, fixed frame size is required).

A mix of Ethernet frame sizes SHALL be used during testing, with the mix of frames being evenly distributed according to the probabilities listed in Table 5.

<table>
<thead>
<tr>
<th>Frame Size (bytes)</th>
<th>Probability</th>
</tr>
</thead>
<tbody>
<tr>
<td>1566</td>

<tr>
<td>70</td>
<td>0.175</td>
</tr>
</tbody>
</table>

Note: All Ethernet frame sizes being on the first byte of the Destination MAC Address and end on the last byte of the Frame Check Sequence (FCS).

To calculate the total number of frames per second to transmit through a connection of a given bit-rate, the following calculations SHALL be used.

\[
\text{Average Frame Size of Mix} \left( \frac{\text{bytes}}{\text{frame}} \right) = \left[ \sum_{i=1}^{M} \text{frame probability}(i) \times \text{frame size}(i) \right].
\]

For the Frame Size Distribution in Table 5, the Average Frame Size of Mix is 1193 bytes.

\[
\text{Required Frame Rate} \left( \frac{\text{frames}}{\text{sec}} \right) = \left[ \frac{\text{RequiredThroughput} \times \frac{1}{8}}{\text{Average Frame Size of Mix}} \right],
\]

where Required Throughput is in units of bits per second, and specified in each specific test case for a specific direction, upstream or downstream.
5.1.3 Physical Layer Test Setup

This section contains the specifications and information required for building the basic physical layer testing environment for G.fast test cases defined in this test plan. Different configurations and settings needed for specific test cases are defined in the related section.

The dotted box shown in Figure 2 is referred to as the 'Physical Layer Test Setup' for test loop topologies, with noise injected, defined in section 5.4.1. The elements within the Physical Layer Test Setup are vendor/lab discretionary.

The combination of the ‘Noise source’ and the ‘Noise injector’ can also be referred to as the ‘Noise generator’.

![Figure 2 – Physical Layer Test Setup](image)

Noise can be injected at the DPU-side, CPE-side, or at each side of the loop. Details about noise injection are specified for each test case as part of its test procedure.

The requirements for the Test Loop Topology are specified in Section 5.4.1.

5.2 Test Setup Characteristics

Test results obtained as a result of testing performed in accordance with TR-380 SHALL contain the information described in sections 5.2.1 and 5.2.2.

5.2.1 Temperature and Humidity

The ranges of temperature and humidity of the test facility, over the entire time tests are conducted, SHALL be recorded in a manner similar to that shown in Table 6 and SHALL be included as part of the test report. The range of temperature SHOULD be between 15 °C (59 °F) and 35 °C (95 °F). The range of humidity SHOULD be between 5% and 85%.
5.2.2 Test Equipment Calibration

The measurement systems documented in this section SHALL be calibrated with traceable and verifiable steps dependent on the specific measurement setup and test equipment.

The test equipment calibration documentation SHALL be included as part of a written test report.

5.2.3 Loops Environment Characteristics

The test loops SHALL be recorded in a manner similar to that shown in Table 7 and SHALL be included as part of the test report.

Table 7 – Loops used for Testing

<table>
<thead>
<tr>
<th>Loop</th>
<th>Coaxial cable type, wire type, wire gauge and length</th>
<th>Diplexer manufacturer, type and serial number</th>
<th>Emulator manufacturer, serial number and model number</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A coaxial cable, wire or emulator description SHALL be included as part of the test report.

5.3 System Under Test settings

This section defines the values for all configuration parameters defined in G.997.2[5] with one default value per configuration parameter. Unless specified otherwise for an individual test case, the G.fast configuration parameter values defined in this section SHALL be used.

5.3.1 Profile Settings

The profile SHALL be configured as defined in Table 8.

Table 8 – G.fast profile configuration

<table>
<thead>
<tr>
<th>Configuration Parameter</th>
<th>G.997.2 reference</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>G.9701 profiles enabling (PROFILES)</td>
<td>7.1.0.1</td>
<td>Only one profile allowed</td>
</tr>
</tbody>
</table>
5.3.2 Time Division Duplexing (TDD) Settings

The TDD SHALL be configured as defined in Table 9.

**Table 9 – TDD configuration**

<table>
<thead>
<tr>
<th>Configuration Parameter</th>
<th>G.997.2 reference</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Symbol periods per TDD frame (MF)</td>
<td>7.1.1.1</td>
<td>36</td>
</tr>
<tr>
<td>Symbol periods per TDD frame dedicated for downstream transmission (Mds)</td>
<td>7.1.1.2</td>
<td>28</td>
</tr>
<tr>
<td>Cyclic Extension (CE)</td>
<td>7.1.1.3</td>
<td>10</td>
</tr>
</tbody>
</table>

5.3.3 Power and Spectrum Usage Settings

The power spectrum usage for twisted pair profiles SHALL be configured as defined in Table 10.

**Table 10 – Power spectrum usage configuration for twisted pair profiles**

<table>

<td>false (disabled)</td>
</tr>
</tbody>
</table>

Table 25 – Data path configuration

5.4 Test Setup

5.4.1 Test Loop Topologies

Single line tests (non-vectored) are performed on two loop types:
- RG-6 coax
- TP-100 twisted pair

5.4.1.1 Single-Pair Cable Test Loop Topology

The twisted single-pair SHALL be of type TP-100.

The twisted single-pair lengths (not including the test leads) SHALL be as defined in Table 26:
Mean Absolute Error (MAE) and Mean Error (ME) for loop X are given by Equation 1 and Equation 2:

**Equation 1: MAE**

\[
MAE_{\text{Loop}X} = \frac{1}{N_t} \sum_{i \in \{A_{Ti} \leq A_{\text{MAX}}\}} |A_{Ri} - A_{Ti}|
\]

**Equation 2: ME**

\[
ME_{\text{Loop}X} = \frac{1}{N_t} \sum_{i \in \{A_{Ti} \leq A_{\text{MAX}}\}} (A_{Ri} - A_{Ti})
\]

where
- \(A_{Ri}\) = Attenuation sample, in dB, of the measured loop X,
- \(A_{Ti}\) = Attenuation sample, in dB, of the theoretical loop X, and
- \(A_{\text{MAX}}\) SHALL be equal to 70 dB.

The \(A_{Ti}\) values SHALL be calculated according to the TP-100 model defined in TR-285[6] Annex E.

The index “i” belongs to a set defined by the points necessary to measure the attenuation in steps of 50kHz or less from 2 MHz to 212 MHz and taking into account only those measurement points for which \(A_{Ti} \leq A_{\text{MAX}}\) dB.

\(N_t\) is the number of elements in the above set.

The loop SHALL be compensated by adjusting the loop length such that the absolute value of ME is minimized while maintaining an MAE less than or equal to 1 dB. The compensation procedure for all loop lengths SHALL be performed with the noise injector connected as shown in Figure 2.

This accuracy requirement SHALL apply for all test loops.

### 5.4.1.2 Single Coaxial Cable Test Loop Topology

The single coaxial cable test loop topology has two test cases:
1) G.fast only (Figure 3)
2) with Diplexer and Satellite TV overlay (Figure 4)

**Figure 3 – Single Coax Test Configuration with G.fast only**

For the G.fast only case the patch coaxial cable connected from the DPU to the Coaxial Cable and from the coaxial cable to the CPE SHALL be of 1m length.

For the Diplexer and Satellite TV overlay case the patch coaxial cable used at the DPU side and the CPE side SHALL be of lengths of 5m and 10m respectively. For the purpose of the test, the SAT and STB are replaced by a 75 Ohm termination.

Both diplexers have identical characteristics and are defined in Annex D of TR-285[6]. There are no splitters or bridged taps in the G.fast path. There are no in-line amplification devices in the G.fast or satellite signal path.

Any balun that is needed to test a device with twisted pair output operating over coax shall be considered as part of the DPU.

The coaxial cable and patch sections SHALL be of type RG-6 with characteristics described in Annex D of TR-285[6].

The coaxial cable lengths (not including the patch sections) SHALL be as defined in Table 27:
Table 27 – Coaxial cable length

<table>
<thead>
<tr>
<th>Loop length for RG-6 (m) case 1</th>
<th>Loop length for RG-6 (m) case 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>50</td>
<td>50</td>
</tr>
<tr>
<td>100</td>
<td>100</td>
</tr>
<tr>
<td>200</td>
<td>200</td>
</tr>
<tr>
<td>400</td>
<td>N/A</td>
</tr>
</tbody>
</table>

When a single port coaxial cable test case is performed on a multiport DPU only a single port SHALL be used. All unused ports SHALL be terminated with a 75 Ohm reference load.

5.4.1.2.1 Coax Cable Accuracy

The RG6 coaxial cable used for testing SHALL meet the following accuracy requirements.

**Note:** The IL of a coax cable is not only determined by its electrical parameters as defined in TR-285[6], but is also influenced by its mechanical and material construction. In order to meet the required accuracy, it may be needed to use a coaxial cable with 90% or higher braid coverage.

The required range of accuracy is loop length dependant.

The f-type connectors are taken into account as an added tolerance with the following values: MIN=0.1dB, TYP=0.15dB, MAX=0.3dB.

The loop SHALL be compensated such that the measured IL (dB) of the RG6 cable used falls within the MIN IL (dB) and MAX IL (dB) range for each of the key frequency points listed in the tables Table 28 trough Table 31. The compensation procedure SHALL be performed with the noise injector connected.

In cases where a switch matrix for automated cable length selection is used, the switch matrix SHALL be present during the compensation procedure.

This accuracy requirement SHALL apply for all test loops.

Table 28 – Accuracy Requirements for 50m RG-6

### 5.4.1.2.2 Diplexer Accuracy

The diplexers used for testing SHALL meet the following accuracy requirements.

Insertion Loss (IL in dB) between Common Port and G.fast Port:
- IL < 5 dB for 30 kHz < f < 430 kHz;
- IL > 40 dB for 2.1 MHz < f < 2.5 MHz;
- IL < 4 dB for 5 MHz < f < 6 MHz;
- IL < 2 dB for 6 MHz < f < 212 MHz;
- IL < 2.5 dB for 212 MHz < f < 806 MHz;
- IL > 40 dB for f > 950 MHz;
where IL is undefined for other frequencies.

Return Loss (RL in dB), with all unused ports terminated with 75 Ohms:
- Common Port: RL > 10 dB for 2.1 MHz < f < 2.5 MHz;
  RL > 10 dB for 5 MHz < f < 212 MHz;
  RL > 10 dB for 950 MHz < f < 2150 MHz;
where RL is undefined for other frequencies.
- G.fast Port: RL > 8.5 dB for 5 MHz > f > 20 MHz;
  RL > 10 dB for 20 MHz > f > 212 MHz.
where RL is undefined for other frequencies.
5.4.2 Noise Models

5.4.2.1 Test Noise for Single Twisted Pair Testing

The test noise is defined as an Additive Gaussian Noise (AGN) that extends from 2 MHz to 240 MHz with a PSD as defined in this section.

**Note:** The AGN extends to 240 MHz so that it is not discontinuous at the 212 MHz boundary of the G.9700/G.9701 signal spectrum.

The test noise PSD for single twisted pair testing, referred to as PSD\(_{TTP}\), is defined as follows (see Figure 5):

\[
PSD_{TTP} = \begin{cases} 
-140 \text{ dBm/Hz} \text{ for } 2 \text{ MHz} \leq f \leq 30 \text{ MHz} & \text{(low frequency region)}; \\
-140 \text{ dBm/Hz} \text{ to } -150 \text{ dBm/Hz} \text{ for } 30 \text{ MHz} \leq f \leq 40.656 \text{ MHz} & \text{(interpolated dB/f region)}; \\
-150 \text{ dBm/Hz} \text{ for } 40.656 \text{ MHz} < f \leq 240 \text{ MHz} & \text{(high frequency region)}. 
\end{cases}
\]

**Note:** This noise PSD definition recognizes that at the higher frequencies above 30 MHz, the test noise, while having a flat spectrum, is lower than at the lower frequencies below 30 MHz.

![Figure 5 – PSD of the Test Noise PSD\(_{TTP}\).](image)

5.4.2.2 Test Noise for Coax Testing

The test noise for coax testing, referred to as PSD\(_{TC}\), is defined as an Additive Gaussian Noise (AGN) that extends from 2 MHz to 240 MHz with a PSD of -150 dBm/Hz.
### 5.4.3 Noise injection

#### 5.4.3.1 Accuracy of noise sources

The determination of ME/MAE accuracy of the noise seen by the SUT SHALL be performed with the internal cabling, switches, loop, noise sources and noise injectors present. All active equipment SHALL be powered on.

Each noise SHALL be measured independently at the terminating points of the 'Physical Layer Test Setup'. This SHALL be done for one noise generator at a time, with the noise generator at the near end (spectrum analyser side) actively generating noise. If present, the noise generator at the far end SHALL be powered on and SHALL NOT generate noise.

The reference load impedance \( R_v \) SHALL be plugged directly into the far-end terminating point of the 'Physical Layer Test Setup'.

The analyzer probe lead SHALL be connected to the near-end terminating point of the 'Physical Layer Test Setup'. This probe lead SHOULD be as short as possible (a few cm).

An example setup is shown in Figure 6.

![Figure 6 – Example Noise calibration setup](image)

With a single-pair Physical Layer Test Setup, \( R_v = 100 \) Ohms.

With a coaxial cable Physical Layer Test Setup, \( R_v = 75 \) Ohms.

At least one measurement SHALL be made per 100 kHz interval with a 100 kHz resolution bandwidth. The Mean Error (ME) and Mean Absolute Error (MAE) of the measured simulated noise level values (in dBm/Hz), relative to the theoretical noise level values (in dBm/Hz), SHALL be calculated.

The Mean Absolute Error (MAE) for noise \( X \) is defined as:

**Formula 1: Noise MAE calculation**

\[
\text{MAE}_{\text{noise } X} = \frac{1}{M} \sum_{\substack{i \in \{P_{RI} > -150 \text{ dBm/Hz}\}}} |P_{RI} - P_{TI}|
\]
The Mean Error (ME) for noise X is defined as:

\[
ME_{\text{noise}} X = \frac{1}{M} \sum_{i \in \{P_{Ri} \geq -150 \text{ dBm/Hz}\}} (P_{Ri} - P_{Ti})
\]

**Note:** Positive error indicates excessive noise power.

where:
- \(P_{Ri}\) = power sample, in dBm/Hz, of the generated noise X,
- \(P_{Ti}\) = power sample, in dBm/Hz, of the theoretical noise X, and
- \(M\) is the number of power samples.

The index “\(i\)” belongs to a set defined by the points necessary to measure the noise power in steps of 100kHz or less and taking into account only those points for which \(P_{Ti} \geq -150\) dBm/Hz.

The noise generator SHALL be compensated such that the absolute value of ME is minimized while maintaining a MAE accuracy of 0.5 dB from 2MHz to 120 MHz and 1 dB from 120 MHz to 240 MHz.

Noise compensation SHALL be done for the 100m loop and applied to all other loop lengths. However, in case the noise ME/MAE requirements cannot be met for the loops other than 100m, a loop specific compensation SHALL be used.

**Note:** For noise calibration, there is measurement uncertainty that can not be compensated, consisting of the following contributions:

1. absolute amplitude accuracy
2. vertical linearity
3. frequency response of the measurement equipment used
4. tolerance of the calibration impedance.

### 5.4.3.2 Test Setup Background Noise Measurement

A measurement of the test setup and lab background noise MAY be made.

The measured noise power levels SHOULD be such that it does not cause a failure of the MAE requirement defined in section 5.4.3.1. This implies the measured noise power level is below the level of the noises generated and injected into the test setup during testing.

The measurement of the laboratory test setup background noise floor MAY exclude narrow band noise "spikes", where a narrow band noise "spike" has a bandwidth of less than 1 MHz and a PSD of less than -100dBm/Hz. The presence of such spikes SHOULD be minimized.

The measurement SHALL be made with a 1 MHz resolution bandwidth.

For statistical relevance the measurement SHALL use an averaging of at least 16 sweeps.

All equipment in the test setup including loop simulator (if applicable), noise generator, and noise injector SHALL be connected and powered on without generating noise.
Figure 6 shows the measurement setup.

The measurement MAY be performed for any test loop in Table 26 and Table 27.

5.4.4 Minimum Interface Speed of the SUT

In the SUT the DPU SHALL support an uplink interface speed of 1 Gbit/s or better. The link partner is expected to have a LAN port interface speed of at least 1 Gbit/s.

5.4.5 Management of the SUT

All configuration/management/status reporting of the FTU-O and FTU-R G.fast interface(s) SHALL be performed through the operation of the FTU-O interface, using the standard control parameters listed above in section 5.3. No configuration of the FTU-R interface shall be performed during this testing (the FTU-R interface(s) is considered a slave to the FTU-O configuration). The configuration of these parameters MAY be operated through any appropriate interface. If a configuration parameter or status parameter is not available and is required for a specific test, that test SHALL be considered as failed.
6 Performance Tests

For each test in this section, reported items/measurements are verified in the expected results as applicable to the SUT. The Table 32 lists parameters (i.e., configuration parameters and reported items/measurements) referred to as “NE/FE” or “ds/us” in the expected results, and how these are applicable to a DPU and a CPE.

Performance test cases are defined in Section 6.1 and 6.2, for the following performance categories:

- Section 6.1.1: Single-line RG-6 coax (data only): CatC_106 and CatC_212
6.1 Single-line Performance Test

6.1.1 Single-line Coax Throughput Test (no diplexer)

6.1.1.1 Purpose

The purpose of this test is to verify that the SUT can establish a stable link of sufficient performance and stability to pass data traffic at the required data rates on a setup without diplexers.

6.1.1.2 Test Setup

1. The SUT SHALL be connected to the test setup shown in Figure 1 and Figure 3
2. The SUT SHALL be configured in 106c or 212c G.fast profile per section 5.3, and Annex X mode SHALL be forced (ANNEX_X_MODE = 2).
3. The coaxial cables with lengths listed in Table 27 case 1, SHALL be used for the testing.
4. The Ethernet/IP Traffic Generator/Analyzer SHALL be configured to transmit a continuous upstream and downstream flow of Ethernet frames.
5. Inject the test noise PSDTC as defined in section 5.4.2.2 at both ends of the loop.

6.1.1.3 Method of Procedure

1. Allow the SUT to establish a G.fast connection through the first loop listed for case 1 in Table 27.
2. Wait 60 seconds to allow the SUT to perform any adjustments to the link.
3. Record the downstream and upstream net data rate (NDRds and NDRus), downstream and upstream gamma data rate (GDRds and GDRus), downstream and upstream signal to noise ratio margin (SNRMds and SNRMus).
4. Start the traffic generator in both the upstream and downstream directions with a required throughput equal to 90% of the GDRus and GDRds respectively, in each direction.
5. Let the traffic run for 5 minutes.
6. Record the total number of frames transmitted and received in the upstream and downstream directions.
7. Repeat steps 1 through 6 for each of the other loops listed in Table 27 case 1.

6.1.1.4 Report

The following items/measurements SHALL be included in the report:

1. The NDRds, NDRus, GDRds, GDRus, SNRMds, SNRMus recorded in step 3 for each loop length.
2. The required frame rate (derived from the required throughput used in step 4, as defined in section 5.1.2) for each direction and for each loop length.
3. The total number of frames transmitted and received in the upstream and downstream directions recorded in step 6 and the derived frame loss ratio in each direction (FLRds and FLRus).
6.1.1.5 Expected Results

The notation “ds/us” applies to the SUT as defined in Table 32.

For each loop length:

1. The aggregate net data rate (i.e., NDRds+NDRus) SHALL be equal to or higher than the required aggregate net data rate indicated in Table 34 for the specific loop length.
2. The GDRds/us SHALL be ≥ 0.99 × NDRds/us.
3. The SNRMds/us SHALL be equal to or higher than the configured SRA downshift margin (SRA DSNRMds/us).
4. The number of dropped downstream (i.e., transmitted minus received) frames SHALL not exceed 5, or the FLRds SHALL not exceed the background FLR defined in section 5.1.1.
5. The number of dropped upstream (i.e., transmitted minus received) frames SHALL not exceed 5, or the FLRus SHALL not exceed the background FLR defined in section 5.1.1.

<table>

</table>

6.1.2 Single-line Coax Throughput Test (diplexer)

6.1.2.1 Purpose

The purpose of this test is to verify that the SUT can establish a stable link of sufficient performance and stability to pass data traffic at the required data rates on a setup with Satellite TV and diplexers.

6.1.2.2 Test Setup

1. The SUT SHALL be connected to the test setup shown in Figure 1 and Figure 4.
2. The SUT SHALL be configured in 106c or 212c G.fast profile per section 5.3, and Annex X mode SHALL be forced (ANNEX_X_MODE = 2).
3. The coaxial cables with lengths listed in Table 27 case 2, SHALL be used for the testing.
4. The Ethernet/IP Traffic Generator/Analyzer SHALL be configured to transmit a continuous upstream and downstream flow of Ethernet frames.
5. Inject the test noise PSD rc as defined in section 5.4.2.2 at both ends of the loop.

6.1.2.3 Method of Procedure

1. Allow the SUT to establish a G.fast connection through the first loop listed for case 2 in Table 27.
2. Wait 60 seconds to allow the SUT to perform any adjustments to the link.
3. Record the downstream and upstream net data rate (NDRds and NDRus), downstream and upstream gamma data rate (GDRds and GDRus), downstream and upstream signal to noise ratio margin (SNRMds and SNRMus).
4. Start the traffic generator in both the upstream and downstream directions with a required throughput equal to 90% of the GDRus and GDRds respectively, in each direction.
5. Let the traffic run for 5 minutes.
6. Record the total number of frames transmitted and received in the upstream and downstream directions.
7. Repeat steps 1 through 6 for each of the other loops listed in Table 27 case 2.

6.1.2.4 Report

The following items/measurements SHALL be included in the report:

1. The NDRds, NDRus, GDRds, GDRus, SNRMds, SNRMus recorded in step 3 for each loop length.
2. The required frame rate (derived from the required throughput used in step 4, as defined in section 5.1.2) for each direction and for each loop length.
3. The total number of frames transmitted and received in the upstream and downstream directions recorded in step 6 and the derived frame loss ratio in each direction (FLRds and FLRus).

6.1.2.5 Expected Results

The notation "ds/us" applies to the SUT as defined in Table 32.

For each loop length:

1. The aggregate net data rate (i.e., NDRds+NDRus) SHALL be equal to or higher than the required aggregate net data rate indicated in Table 35 for the specific loop length.
2. The GDRds/us SHALL be \( \geq 0.99 \times \text{NDRds/us} \).
3. The SNRMds/us SHALL be equal to or higher than the configured SRA downshift margin (SRA DSNRMds/us).
4. The number of dropped downstream (i.e., transmitted minus received) frames SHALL not exceed 5, or the FLRds SHALL not exceed the background FLR defined in section 5.1.1.
5. The number of dropped upstream (i.e., transmitted minus received) frames SHALL not exceed 5, or the FLRus SHALL not exceed the background FLR defined in section 5.1.1.

6.1.3 Single Twisted Pair Net Data Rate Performance Test
6.1.3.1 Purpose

The purpose of this test is to measure the single line rate reach performance on twisted pair of the SUT.

6.1.3.2 Test Setup

1. The SUT SHALL be connected to the test setup shown in Figure 1
2. The SUT SHALL be configured 106a, 212a, or 106b G.fast profile per section 5.3.
3. The loops with lengths listed in Table 26 and defined in section 5.4.1.1 SHALL be used for testing.
4. Inject the background noise PSD_{TPP} as defined in section 5.4.2.1 at both ends of the loop.

6.1.3.3 Method of Procedure

1. Allow the SUT to establish a G.fast connection through the first loop listed in Table 26.
2. Wait 30 seconds to allow the SUT to perform any adjustments to the link.
3. Record the downstream and upstream net data rate (NDRds and NDRus), downstream and upstream gamma data rate (GDRds and GDRus), downstream and upstream signal to noise ratio margin (SNRMds and SNRMus).
4. Repeat steps 1 through 3 for each of the other loops listed in Table 26.

6.1.3.4 Report

The following items/measurements SHALL be included in the report:

1. The NDRds, NDRus, GDRds, GDRus, SNRMds, SNRMus recorded in step 3 for each loop length.

6.1.3.5 Expected Results

For each loop length in Table 26:

1. For the loop lengths larger or equal to 100m, the SNRMds/us SHALL be within the bounds of the configured SRA downshift margin (SRA-DSNRMds/us) and SRA upshift margin (SRA-USNRMds/us), inclusively.
2. For the loop lengths 35 and 50m, the SNRMds/us SHALL be larger than the configured SRA downshift margin (SRA-DSNRMds/us).
3. The aggregate net data rate (i.e., NDRds+NDRus) SHALL be equal to or higher than the required aggregate net data rate indicated in Table 36 for the specific loop length.

**Note:**
Gen 1 refers to Gfast systems implementing the feature set and requirements as defined in the Gfast Certification test plan issue 1 (ATP-337 Issue 1).

Gen 2 refers to Gfast systems implementing the feature set and requirements as defined in the Gfast Certification test plan issue 2, including amendments (ATP-337 Issue 2).
7 Functional Tests

7.1 Attainable Net Data Rate Test

7.1.1 Purpose
The purpose of this test is to verify the reliability of the Attainable net data rate (ATTNDR) parameter.

7.1.2 Test Setup
1. The SUT SHALL be connected to the test setup shown in Figure 1.
2. The SUT SHALL be configured according to section 5.3.
3. The loops of 50m, 100m, 200m, as defined in section 5.4.1 SHALL be used for the testing.

7.1.3 Method of Procedure
1. Configure the MAXNDRds and MAXGDRds to 100 000 kbit/s, and MAXNDRus and MAXGDRus to 20 000 kbit/s for the 106 MHz profiles or 40 000 kbits/s for the 212 MHz profiles.
2. Allow the SUT establish a G.fast connection through the loop.
3. Wait 60 seconds to allow the SUT to perform any adjustments to the link.
4. Record the downstream and upstream Attainable net data rate (ATTNDR).
5. Reconfigure the MAXNDR and MAXGDR to default values specified in Table 23 and allow the system to retrain.
6. Wait 60 seconds to allow the SUT to perform any adjustments to the link.
7. Record the downstream and upstream net data rate (NDR).
8. Repeat Steps 1-7 for each of the test loops.
9. Repeat Steps 1-8 for a different randomly selected valid value of Mds.

7.1.4 Expected Results
For each of the measurements:

- For 50m: 0.975 * ATTNDRds/us - 1 Mbit/s < NDRds/us < 1.025 * ATTNDRds/us + 1 Mbit/s,
- For 100m: 0.97 * ATTNDRds/us - 1 Mbit/s < NDRds/us < 1.03 * ATTNDRds/us + 1 Mbit/s,
- For 200m: 0.96 * ATTNDRds/us - 1 Mbit/s < NDRds/us < 1.04 * ATTNDRds/us + 1 Mbit/s.
